8. Bridge over the Don River near Kalatch-on-Don

Designer: Design Institute Giprotransmost

*Contractor: A constructional organization of
Glavmostostroi*

Sphere of application: The bridge is meant to have 2 lanes for vehicular traffic and pedestrians

Full deck width: 12.0 m including the 9 m-wide roadway

Static system: a continuous multispan girder

$$(54.0 + 9 \times 84.0 + 54.0 + 2 \times 24.8)$$

Longitudinal grade up to 3 per cent

Materials used per m² of the continuous se-

- prestressed concrete M-500: 0.536 m³

- prestressed concrete in
- high-strength reinforce

- ordinary reinforcement: 57.4 kg

- reinforced concrete M-300 for side-walk blocks: 0.05

Traffic opened: in 1976

The river part of the bridge is crossed by

The river part of the bridge
was constructed by

The river part of the bridge is crossed by a continuous 11-span prestressed box girder (Fig. 1). The box girder assembled of precast elements has inclined webs and a cantilever upper slab. The girder depth varies from 3.16 m in the middle of spans to 4.5 m over piers (Fig. 2).

Epoxy adhesive joints are used between adjacent elements squeezed by high-strength tendons located in closed ducts, a considerable number of inclined tendons threaded into the box webs. Each tendon consists of 48 wires $d = 5$ mm having 1700 kg/cm^2 normative resistance.

The continuous girder is assembled of 310 elements weighing from 42 to 53 tons. The dimension uniformity of most of the elements (230 from 310) allowed their prefabrication near the site.

The superstructure was erected by balanced cantilevered method with the help of a cantilever erecting portal crane (Fig. 3).

The approach part of the bridge is assembled of prestressed T-beams 24.8 m long, united by a continuous deck slab.

They were erected by crawler cranes.

Due to the continuous multispan system, only two expansion joints were arranged along the whole bridge length, which provides favourable conditions for traffic.

The river pier foundations are mounted on bored piles $d = 1.35$ m. One form was used for concreting massive solid piers above the pilework, irrespective of their heights. The approach viaduct piers are precast and cast-in-place
