The college is composed of volumes interconnected by covered passage-ways and green or paved quadrangles. Using the already existing stand of trees, Jacobsen worked out the land-scape design, producing something having the effect of an English park, quite different from the symmetrical Continental style of garden. It is self-contained and secluded, to cut out road noises. The planting scheme is the dominant element. The central entrance hall is reached along the river. This hall, being located on the ground level of the west resi-dence wing, looks into a very large green quadrangle, which is bounded by the two residence wings, the refec-tory, the library and by covered pas-sageways, connecting these various buildings.

buildings.

sageways, connecting these various buildings. The intimate common rooms, on one level, are grouped together around small courts with north access to the refectory, which, with its great height and overhead lighting, is adapted to the traditional ceremonial style of life still prevailing at an English university, which in some respects resembles a monastery. The chairs with high backs and the pin-point lighting on each table harmonize well with the required dark academic gowns. The library with its galleries, where the books are kept, is illuminated in-directly by counter-ceiling elements; this arrangement encourages greater concentration on the part of the stu-dents. The covered passageways con-necting the library, the refectory and the residence quarters are bounded by walls forming recesses, where stu-dents can engage in discussions. In any case, meditation has an im-portant place in the concention of the

by waits forming recesses, where sud-dents can engage in discussions. In any case, meditation has an im-portant place in the conception of the college: thus, along the big pool, benches surrounded by wall-screens make for privacy. Between the library and the lecture theatres there is an-other quadrangle, surrounded by walls, accommodating the clock-tower, which dominates the entire complex. The residence quarters, with two flats on the ground floor, occupied by the professors and the students of the upper classes, and two upper levels with 5 rooms each occupied by stu-dents of the lower classes, are made up of eight independent parts, group-ed around a stairwell and equipped on each level with a bathroom, WC and a small kitchen.

and a small kitchen. This arrangement corresponds to the typical English college lay-out. More-over, in the over-all conception, Jacobsen has sought to adapt to spe-cific English traditions. A large pool runs along the whole site in front of the residences and permits direct access from the ground-floor flats, for which it constitutes a prolongation of the interior area. At the south extrem-ity of the site is the music pavilion,

whose plan is freely conceived for acoustic reasons and which gives the effect of a crystal against the back-ground of trees.

Construction: a module of 3.20/2.45 m, dictates the structure of the complex: beams of pre-fab concrete, placed on walls of raw brick (common rooms, inter-axial distance: 2.45 m.) framework of pre-fab reinforced concrete (residences, inter-axial: 3.20 = width of rooms), cruciform supports of pre-fab con-crete (large areas: auditorium refec-tory, library) taking stringers of pre-fab concrete, structure of secondary roofing string-

structure of secondary roofing string-ers of pre-fab concrete (inter-axit): 2.45).

2.45). The application of the basic scheme depends on the function of each detail: The supports of the refectory are 3 meters from the face, and the ex-terior non-supporting walls are taken by the principal stringers which cross the face.

the face. Continuous glazing further accents the construction. The roofing is made up of light pre-fab concrete slabs, placed on the secondary structure. The emplacement of the continuous glazing is not usual. The artifical illlu-mination is attached to the counter cellings

ceilings.

ceilings. The face of the library is located in the structural plan at ground-floor level, which takes the steel structure of the upper galleries, where the stacks appear. The structure support-ing the roof is the same as that of the refectory. The non-supporting faces are generally glazed.

This construction principle may ap-pear mannered, but it permits a clear distinction betweeen the supporting and non-supporting parts of the building.

The auditorium now under construc-tion is based on the same structural principle, which constitutes a large volume on two levels and small gal-leries around the upper floor.

The music pavilion is made up of brick supporting walls and reinforced concrete slabs.

Materials:

Materials: exterior facing: yellow concrete slabs; thickness: 5 m. Interior facing: white cement. Structure of pre-fab reinforced concrete, poured in smooth jointless coffering, windows and outside doors either of eloxidized aluminium or of bronze, brise-soleil and facing of fa-cade of library, of bronze; doors of auditorium of oak. Flooring of green slate in the refectory, of linoleum in the other rooms. Counter ceilings of perforated aluminium panels. Heating via radiators, via floor units (large volumes) or air-conditioning (auditorium).

(auditorium).
