Switzerland's Underground – Part 1

Introduction

Under Switzerland there is a second nation: a Switzerland beneath the earth – a hidden realm not visible from above; established over the past 150 years. If all the man-made caverns, ducts, galleries, bunkers and tunnels were put in a row, they would reach over 3,700 km (approx. Sydney to Paris). Many parts have only restricted access, and the common saying that Switzerland is as full of holes as Emmentaler cheese is actually quite correct!

This underground world reflects an important Swiss requirement – security! It provides for many diverse needs: fast and secure transport links (particularly in Winter); home bunkers to protect the civilian population; independent electricity supply; fortified sites providing armed military protection; secure research and development sites; safe storage of sensitive information and data; and the concealment of valuables.

Very few parts of Switzerland have been hollowed out for the value of any sort of mined raw materials – on the contrary, it has occurred solely for the value of the voids and hollows themselves, which fulfil many specific purposes. The Gotthard Rail Tunnel is one of the most prominent examples – travel time through this North-South mountain void has been substantially reduced.

However, sometimes the intentions behind creating these underground hollows have lost their worth over time. Hundreds of Swiss Army sites have eventually become redundant for various reasons: because of their age, weakness or incorrect positions; or simply because they were no longer needed. Some well-intentioned tunnel builds have even later been written off – a 5km stretch diverging off the main Furka Tunnel line was never used and has since been blocked off! As well, the 2km SBB Lenten Tunnel under Zürich was no longer needed around 1989 and so was unceremoniously filled in. An old Commando bunker in Canton Aargau was unexpectedly discovered

A part of the Oberhasli underground pump station

Part of the 'alpine labyrinth of tunnels' to house the underground Grimsel power stations

in 2011 during other construction work – and not even anyone in the Defence Ministry knew or found any record of its existence!

Water

20% of Switzerland's water is taken from lakes, forced past turbines and fed into reservoirs where it is stored to eventually become clean drinking water. The other 80% comes from underground springs and bores. Switzerland's drinking water circulates through a net of 53,000 km of underground pipes to reach every settlement and tap. Waste water is then fed through further underground channels to purification plants. Small hydro power stations have now even been established to make use of this fast flowing waste water, as in Chr.

Hydro Electricity

A major portion of collected water is used to generate electricity and this occurs mainly underground. The 1300 plus large and small power stations basically function just like water wheels which turn the power generator. Every single drop of water travels past an average of 10 turbines on its journey from one station to the next. The water passes through multiple pipelines and ducts in the mountain massifs: from one valley to the other, from one reservoir to the next turbine.

Construction of one such generating system, Oberhasli, in and around the Grimsel and Susten mountains, commenced in the 1920s and has expanded in size with increased

demand. Only the mountain lakes and transmission lines are visible though – most of the facility is situated underground. Inside these huge mountain ranges are over 100 km of road and rail tunnels, allowing secure passage, as well as ensuring continuous access to all the underground power stations. The water from the many mountain lakes travels through numerous waterways, reservoirs and pipelines to reach nine power stations totalling 29 turbines – all unseen – but now producing power for over one million people, as well as providing over 500 jobs.

The uninitiated would certainly become hopelessly lost within this alpine labyrinth, with many parts only accessible on

The Grimsel storage lakes feeding Oberhasli power stations

foot. Many cable railways and cable car lines have also since been established by the Oberhasli power company to improve access and some of these have now also become tourist attractions. Construction here is ongoing, with plans for more water catchments and power generators. The availability of this sort of renewable energy leaves Switzerland well positioned for future power needs, with the added advantage of maintaining price stability.

And the next innovative pump storage plants and reservoirs are already under construction – the Mammutwerken at Linth-Limmern, Canton Glarus, and Nant de Drance, Canton Valais. At the heart of each site will be the enormous underground caverns containing the actual generating plants: at 52m high and 32m wide; and 154m and 194m long respectively. The construction of many kilometres of underground access tunnels, galleries and pipelines will also be required, and each site will eventually produce the same amount of energy as the current atomic power station of Goessin.

The underground voids currently housing Switzerland's hydro power stations, if put side by side, would be over 800 km long, equal to if a tunnel were built from Whangarei to Wellington!

More of Switzerland's Underground in the next issue of the Helvetia

Basler Fasnacht (Carnival)

The Basler Fasnacht starts on the Monday after Ash Wednesday at precisely 4:00 am with the so-called Morgestreich. The carnival lasts for exactly 72 hours and, therefore, ends on Thursday morning at 4:00 am. During this time the Fasnächtler (the participants) dominate the old town of central Basel, running free in the streets and restaurants. Basler Fasnacht is often referred to as die drei scheeneste Dääg ("the three most beautiful days").

The approximately 18,000 active Fasnächtler dress up in a wide variety of costumes, including a mask known as a Larve. Participants are fully concealed and must remain incognito while parading; it is considered inappropriate and a breach of protocol to identify oneself by removing the mask, other than during official breaks from the parade. Members of the various Cliques wear costumes that fit a specific theme, except during Morgestreich and on Fasnacht Tuesday. Costumes and masks commonly represent famous people including politicians, or even comic characters or animals. More traditional masks recall Napoleonic soldiers, harlequins (Harlekin) and the famous Waggis.

According to some local historians, the throwing of confetti is a typical tradition from Basel that later spread to the rest of the world. While there is no proof for this theory, the amount of confetti used during Basler Fasnacht is huge in comparison to other carnivals.

Originally, sweets in the form of small sugar balls known as confetti (an Italian name, similar to the English confectionery) were given away or thrown at the crowd during the parade. After this practice was prohibited in the 19th century, small shards of paper were used as a replacement. Until it was banned in the second half of the 20th century, it was also common to use straw instead of confetti, although wheat chaff is still sometimes thrown in some of the outlying towns and regions.

In the Basel German dialect, confetti is called Röppli, and only single-coloured confetti can be purchased in Basel. Confetti is available in all possible colours, but never mixed. This was decided by the regional confetti manufacturers to prevent the once-common practice of reselling "used" confetti. Throwing mixed confetti is seen as very bad form, since one would have picked it up from the street, which is obviously an unhygienic practice.

For spectators, there is the ever-present danger of being attacked from behind by a confetti-throwing Waggis, especially if not wearing a Carnival badge known as a Blaggedde (which sounds similar toquette to French and English listeners). It is an unwritten law that masked and/or costumed participants are not subject to confetti attacks.

By the evening, the routes of the Cortège are ankle-deep in confetti. Even so, Basel's sanitation department succeeds in clearing away this mess within two hours during the night, so, by the following morning, there is little evidence of the previous day's events.

Marching brass bands playing Guggenmusik are another formation present during Carnival. Although the Guggemusik groups do not participate on Morgestreich, they march and play throughout Fasnacht, starting with the Cortège on Monday, and are showcased on Tuesday night when they perform in Guggeconcerts in various locations.

It remains unclear exactly why Carnival starts one week later in Basel than elsewhere in Switzerland or Germany. The common explanation is that after the Reformation in 1520, Basel continued celebrating its Fasnacht, while the other regions officially stopped. It is said, that in order to differ from the Catholic customs, Fasnacht was scheduled one week later starting in 1529. There are no documents from this era supporting this theory, and the resolutions from 1529 were not quoted until 200 years later.

Historians note that the Catholic carnival date was rescheduled six days earlier in 1091 in the Council of Benevento, because the Sundays were excluded from the 40-day fasting period before Easter, making Ash Wednesday the first day of Lent. From then until the 16th century, the two carnival dates existed. The first one, ending on Ash Wednesday, was known as the Herren- or Pfaffenfasnacht (lords' or priests' carnival) and was observed by those members of the higher echelons of society. The second, one week later at the old time, was known as

The Apprentice Yodeller

Why would a young man join a group of older and very experienced Swiss yodellers when he was born and educated in Auckland and is a descendant of a family who, for more than 6 generations, have lived down under?

I first noticed Frederick Conquer when the Swiss Kiwi Yodellers were performing at a function in Hamilton. Curiosity got the better of me and I contacted Frederick to find out.

This gregarious, intelligent young man's life took on a new dimension when he found himself looking for an overseas adventure after finishing college. He opted for a student's overseas exchange with AFS, studying in Liestal, Basel-Landschaft, living with a wonderful host family whom Frederick now considers his Swiss relatives.

Liestal is just outside of Basel and dates back at least to Roman times. Like many small Swiss cities, it has the most amazing feel which Frederick enjoyed immensely. The tangible history, the people, and the old town were captivating.

Whilst living with his host family (Marion, Gerhard, Julian, and Gregor) he lapped up the cultural differences, taking part in festivals and events across Switzerland: like Fasnacht, l'Escalade, Sechseläuten, Zibelemärit and many others. When studies allowed, (or sometimes even if they didn't) he explored every Canton in Switzerland and enjoyed skiing, hiking and swimming in the Rhine.

He also enjoyed cooking and made good use of Betti Bossi recipes as well as introducing his host family to NZ foods such as pavlovas and anzac biscuits (although he did have to have a major hunt in food stores for the golden syrup!!!).

Eventually Frederick returned to NZ and completed a Bachelor of Commerce and a Diploma of Languages in German at Auckland University before beginning work at Fonterra in Global Supply Chain. "I love cheese, and it was of no surprise to anyone that I decided to work for a dairy company."

Frederick has mostly lived in rural settings and currently lives rurally on the edge of Auckland. "It makes for a long commute but I enjoy living there," he said.

In 2015 he decided that he wanted to spend a bit more time around Swiss-German language and also had an interest in music. Attending the Auckland

Swiss Market, he heard the Swiss Kiwi Yodellers - here was an opportunity to fulfil both his wishes.

"What better way than joining the yodel group, an interesting and unusual group/type of music, but I have really enjoyed it. I sing first tenor with Kurt, who has been very helpful with the singing, Albert and Oscar with the alphorn. All of the group have been very welcoming and supportive. Remembering the lyrics is tricky but my grandmother is a music teacher and has been a lot of help as her musical ear is well tuned!"

"The rehearsals," Frederick tells me, "are a bit sporadic due to the lifestyles that the Auckland Swiss Yodel group lead with many of the retired members travelling and thus unavailable for regular rehearsals."

Frederick's wish is that more people like himself whatever age, whatever background, with an interest in different forms of music and singing, come join the group.

At 24 years of age, Frederick has many years of yodelling and alphorn playing ahead of him. You never know, he may eventually end up in Switzerland furthering the skills he is learning in NZ.

Yodelling earmarked for UNESCO World Heritage status

Switzerland plans to request alpine art of yodelling added to UNESCO list of world's protected "intangible heritage"

The alpine art of yodelling may soon be awarded UNESCO World Heritage status if Switzerland gets its way. The Swiss government has announced a list of eight traditions it wants added to the World Heritage list.

Yodelling may seem a strange addition to a list that currently features the Taj Mahal, the historic centre of Rome and Stonehenge but it follows in the footsteps of the Argentinian tango, the Mediterranean diet and falconry, all of which have already been given World Heritage status by UNESCO.

Originally, the World Heritage list was reserved for buildings, monuments and sites of natural beauty but in 2003, UNESCO agreed to start adding "intangible heritage", and since then a number of more eccentric choices have been added to the list.

the Bauernfasnacht (farmers' carnival). Afterwards, only this second carnival was celebrated in Basel. Today, the Carnival of Basel is said to be "the only Protestant carnival in the world".

Fastnachtkuechlein

(Oehrli or Chnaeublaetze) translated Carnival Cakes (Ears or Knee patches)

Recipe

2 Eggs
4 Tbsp Cream
1 pinch salt
2 Tbsp Sugar
250-300g Flour

Beat eggs, salt, sugar and cream together. Add flour and knead together on a board until the dough has air bubbles. Add only enough flour so that dough is of smooth consistency and easy to pull apart. Let the dough rest for half an hour in a warm room and then cut into bite size pieces. Roll these out until paper-thin and continue to make thinner by pulling between fingers or best done over your knees (hence where the name Knee patches comes from). Lay these thin pieces out on cotton sheets to dry and then cook in a deep pan of very hot cooking oil until golden brown. It is easiest to use two wooden sticks to scrunch up and turn in the cooking oil. Once cooled sprinkled with icing sugar and they ready to eat or store in a dry air-tight container.

My Mum has made these for many years, starting in the early years of settling in Hamilton and then for about the next forty or fifty years. She used to make about 50 at a time and store them in biscuit tins in the hope they would last for several weeks.

In the last few years one of our Hamilton Club members Rinaldo Rust together with his wife Gritli have made them and brought them along to our annual picnic - see photo. For many people this has brought back fond memories of having them in Switzerland where you can buy them at the local supermarket or bakery if you don't want to go to the trouble of making them yourself. *Compiled by Anita Zuber*
