Solar Limb Spray of 31 August 2002

ROBERT B. SLOBINS

On the afternoon of 31 August 2002, I set up my Hydrogen-alpha observing equipment for a session. I use an 200 mm f/10 Schmidt-Cassegrain telescope and a Coronado Instruments ASP-60/BF15 H-alpha filter combination. This makes this telescope into an f/33 system. I load a Nikon F2 body with Fuji Velvia (ISO 50) film and attach it to the BF15 filter. The exposure for moderately bright prominences is 1/11 second.

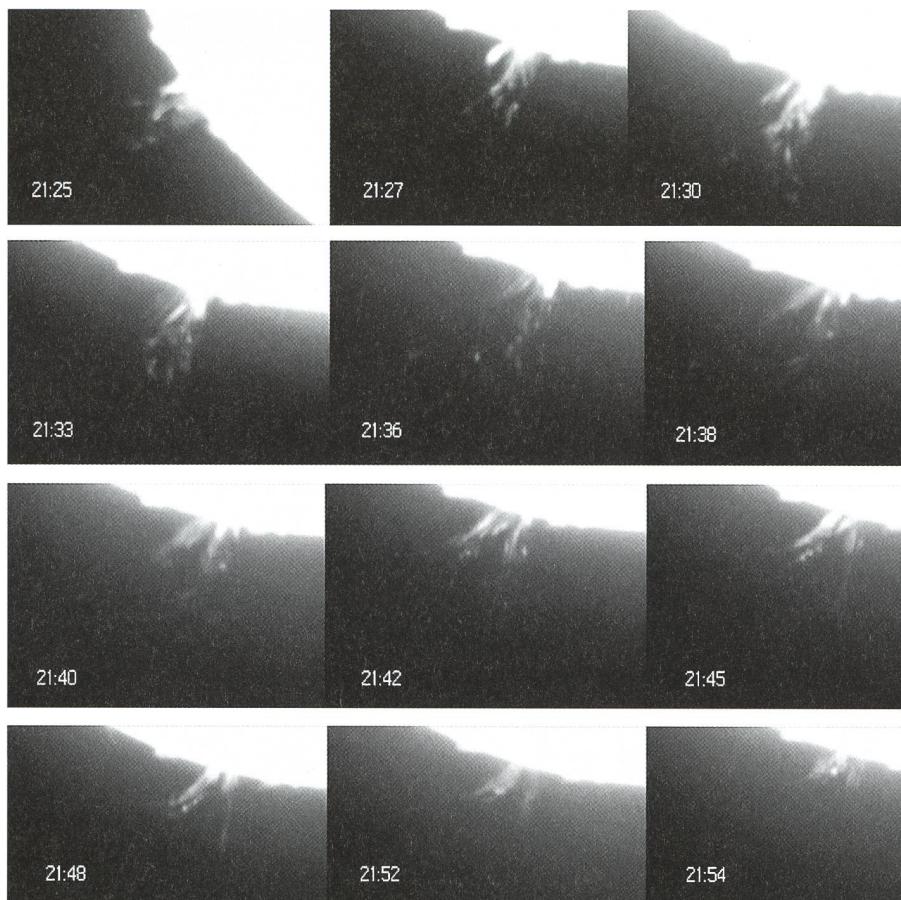

At 21:20 UTC on 31 August 2002, I observed a sudden surge prominence on or behind the eastern limb near the solar equator. This was in a region of continuing activity and fast motions that lasted for several more days. This surge developed into several prominences that sprayed out from this surge like a water fountain. I proceeded to photograph the event. The ground glass view-finder blurred most of the detail, but I could see very fast motions in this spray structure that caused distinct changes in this prominence to be visible over the span of fifteen seconds. Some of the material was seen to over 1/4 solar radius, a distance of halfway to the moon from the earth. This show lasted to 21:54 UTC.

The significant aspect of this rare limb spray was that no one else recorded or witnessed it. All of the H-alpha ob-

servatories in the USA and Australia did not record it. The monitoring site on WWW.spacew.com was receiving nothing from California or Hawaii as is usually the case at that time of day.

On the afternoon of 5 September 2002, a long filament on the sun collapsed on the solar surface. The result was a Hyper flare and a coronal mass ejection that arrived at the earth about 16:30 UTC. North America witnessed the final parts of the geomagnetic storm on 7-8 September (UTC).
