BOILING WATER REACTOR FOR THE B.K.W. ATOMIC POWER STATION IN SWITZERLAND

As already known, the Bernische Kraftwerke AG (BKW) are planning the installation of an atomic power station in the vicinity of Mühleberg. The Management of BKW have now decided to equip this power station with a boiling-water reactor manufactured by General Electric (U.S.A.). They have studied the tenders submitted by Brown Boveri & Cie., Baden (BBC) in association with the General Electric Technical Services Co. Inc., New York (GETSCO), and have authorised these Companies to enter into an agreement for the construction of the completed plant, under the administration of BBC, with the proviso that the final decisions will be made at the BKW shareholders' meeting.

The boiling-water reactor is moderated and cooled with light water: the steam generated in the reactor is led directly to the turbines. The Mühleberg atomic power station will have a guaranteed nett output of 306 m.W. and, at full load, will be able to produce well over 2 billion k.W. hours per year. Thanks to the progress in reactor technique, favourable generating costs can be achieved.

Construction will commence early in 1967, subject to the agreement of the authorities concerned. Construction time, including testing, will be 54 months, so that the nuclear power station can be taken over for normal working in the autumn of 1971.
